

Use Case: HeroForge Application **Character View Case**

Summary: This is a use case for viewing a character.

preconditions:

1. Character has already been previously generated
2. App can connect to server and database
3. Character information has been retrieved

Case Starts With: User presses the “Edit Character” button

Main Success:

1. The program displays the “Character Name” field
2. The user inputs the character’s name
3. The app retrieves the character’s information
4. The program displays the character’s name
5. The program displays the character’s class
6. The program displays the character’s race
7. The program displays the character’s level
8. The program displays the strength value
9. The program displays the intelligence value
10. The program displays the wisdom value
11. The program displays the constitution value
12. The program displays the dexterity value
13. The program displays the charisma value
14. When finished viewing the character, the user presses the exit button.

Alternative Success: If the app cannot connect to the database to retrieve the user’s character, it will give the user an error message to let them know something is wrong with the connectivity.

Postconditions:

1. The view activity successfully closes

Rules:

1. Character must exist
2. Character name must be spelled correctly for lookup
